

# Localization Radius

Yicun Zhen

Sep 13, 2013

# Outline

- 1 **Scheme**
- 2 **Mathematical Stuff and Algorithm**
- 3 **Numerical Tests**

## Steps

- Define a cost function  $F$
- compute the value of cost function for several different localization parameter  $\lambda$
- choose the  $\lambda$  that gives the least value of  $F$
- use that  $\lambda$  to do sequential localized EnKF

## Question

How to define the cost function  $\lambda$ ?

## Definition in last time

Fix the influence radius for each observation  $y_i^o$ , and compute the mean difference of the updates for the localized and un-localized sequential EnKF.

### cost function in the last time

$$F(\lambda, i) = \int \sum_{j=1}^n (r_{ij}^S \rho_\lambda(d_{ij}) - r_{ij})^2 p(B|S) dB$$

where  $n$  is the number of gridpoints in the neighbor region in consideration.

## notation

$r_{ij}^S$  is the sample regression coefficient of using observation  $y_i^O$  to update mean state at grid point  $x_j$

$$X_j^{mean} \leftarrow X_j^{mean} + r_{ij}^S \Delta y_i$$

$r_{ij}$  is the true regression coefficient of using observation  $y_i^O$  to update mean state at grid point  $x_j$

$$X_j^{mean} \leftarrow X_j^{mean} + r_{ij} \Delta y_i$$

## Critical problem with last cost function

The resulting  $\lambda$  is always equal to 0 which means no localization is needed.

## New cost function

$$F(\lambda, n) = F_V(\lambda, n) - F_E(\lambda, n)$$

where

- $F_E$  is an updating effect function
- $F_V$  is a pseudo-variance function

## Definition of $F_E$ and $F_V$

$$F_E(\lambda, n) = C(S) \left\{ \int \sum_{i=2}^n [r_i^2 - (r_i^s \rho_\lambda(d_i) - r_i)^2] p(B^s|B) p(B) dB \right\} \quad (1)$$

where  $C(S)$  is a constant depending only on the sample and  $n$  such that:

$$C(S) \int p(B^s|B) p(B) dB = 1 \quad (2)$$

And we define the variance-like function:

$$F_V(\lambda, n) = C(S) \left\{ \int \sum_{i=2}^n \rho_\lambda(d_i)^2 (r_i^s - r_i)^2 p(B^s|B) p(B) dB \right\} \quad (3)$$

## Theorem

$$F_E(\lambda, n) = \sum_{i=2}^n \left\{ 2\rho_\lambda(d_i)\theta_i \mathbf{e}_i \frac{\int_0^\infty e^{-\frac{1}{2}t_1^2} \frac{t_1^{N-n-1}}{rt_1^2 + |\epsilon_1|^2} dt_1}{\int_0^\infty e^{-\frac{1}{2}t_1^2} t_1^{N-n-1} dt_1} - \rho_\lambda^2(d_i)\theta_i^2 \right\} \quad (4)$$

$$F_V(\lambda, n) = \sum_{i=2}^n \rho_\lambda^2(d_i) \left\{ \theta_i^2 - 2\theta_i \mathbf{e}_i \frac{\int_0^\infty e^{-\frac{1}{2}t_1^2} \frac{t_1^{N-n-1}}{rt_1^2 + |\epsilon_1|^2} dt_1}{\int_0^\infty e^{-\frac{1}{2}t_1^2} t_1^{N-n-1} dt_1} + \left( \frac{\Delta_{ii}|\epsilon_1|^2}{N-n-1} + \mathbf{e}_i^2 \right) \frac{\int_0^\infty e^{-\frac{1}{2}t_1^2} \frac{t_1^{N-n-1}}{(rt_1^2 + |\epsilon_1|^2)^2} dt_1}{\int_0^\infty e^{-\frac{1}{2}t_1^2} t_1^{N-n-1} dt_1} \right\} \quad (5)$$

## Algorithm

- Have some value of  $\lambda$  in mind.
- For each observation  $y_i^o$  and for those  $\lambda$ , find the influence radius (hence  $n_\lambda$ ) for each  $\lambda$  compute the value of the new cost function  $F$  for each  $\lambda$  and find the  $\lambda$  that corresponds to the minimum  $F$  value.
- Hence for each observation  $y_i^o$  we have a unique  $\lambda_i$  that is optimal for  $y_i^o$
- Use any method (for example, kernel density estimation) to find the maximum likelihood of  $\lambda$
- use the maximum likelihood  $\lambda$  to be the  $\lambda$  we use in this assimilation cycle.

### computational cost

$$O(N^3 m)$$

## Notations

Model: Lorentz 96.

$n$ : number of variables.

$m$ : number of observations.

$N$ : ensemble size.

## Set 1

 $n=40, m=20, N=31, 41, 51, 61$ 
(a)  $N=31$ (b)  $N=41$ (c)  $N=51$ (d)  $N=61$ 

**Conclusion:**  
 larger ensemble size  
 $\Rightarrow$   
 larger localization radius

## Set 1

 $n=40, m=20, N=31, 41, 51, 61$ (d)  $N=31$ (e)  $N=41$ (f)  $N=51$ (g)  $N=61$ Plot of  $F$  values at different observation

## Set 2

 $n=48, N=51, m=12, 16, 24$ 
(g)  $m=12, N=51$ (h)  $m=16, N=51$ (i)  $m=24, N=51$ (j)  $m=12, N=31$ (k)  $m=16, N=31$ (l)  $m=24, N=31$

## Set 3

$N=51, n=40, 300, 1000, m=20, 150, 500$

(m)  $m=20, n=40$

(n)  $m=150, n=300$

(o)  $m=500, n=1000$
