

**GOES-13 data assimilation with PSU-EnKF
Hurricane Joaquin (2015):
Track and Intensity**

Lei Zhu

Operational forecasts

Satellite Obs

GOES-13 Imager:

Geostationary orbit; altitude 35786km; 75° W;

5 channels:

Visible channel: 0.65 μ m (0.55-0.75, 1km resolution)

Infrared channel: 3.90 μ m (3.80-4.00); 6.55 μ m (5.80-7.30, 4km, water vapor channel); 10.70 μ m (10.2-11.2); 13.35 μ m (13.0-13.7)

DA system:

PSU realtime EnKF-WRF system

Experimental set-up

1. 12-hour free ensemble forecasts from 09/28/00/2015
2. DA initiates from 09/28/12, every 3-hour til 10/05/00 (haven't done yet), with and without GOES-13 radiance data (Channel 3)
3. Do deterministic forecasts every 6-hour

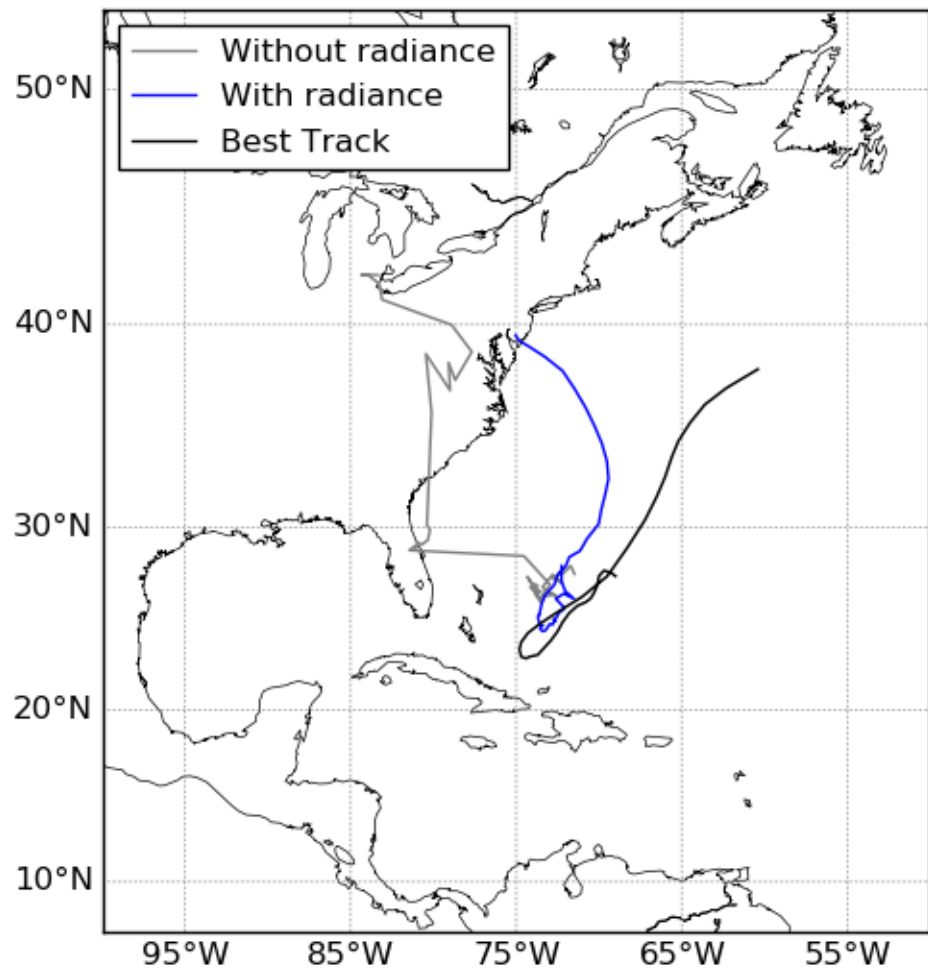

09/28/12

09/29/00

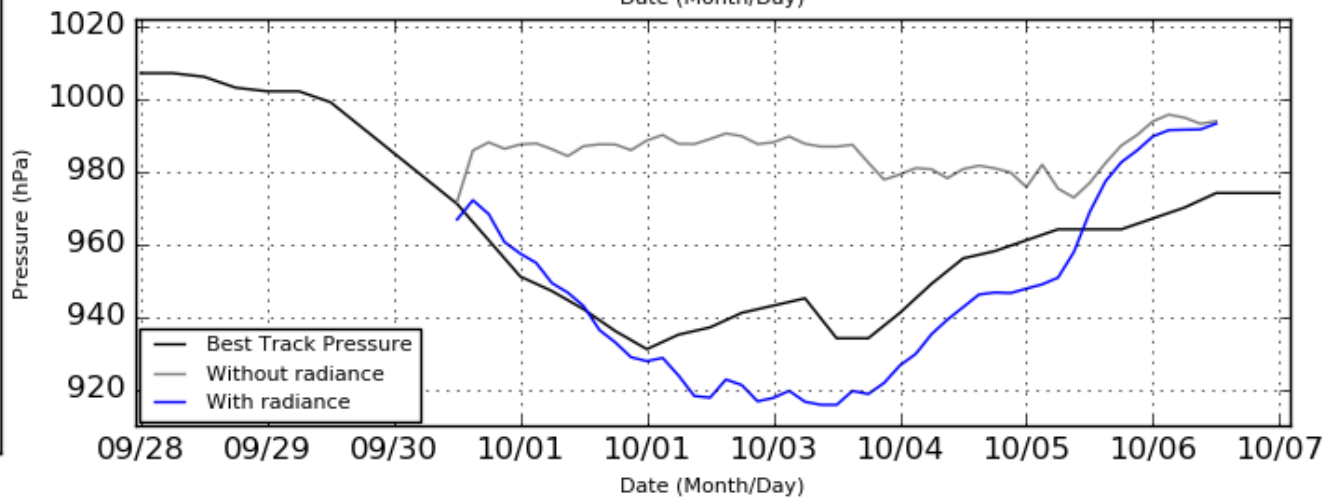

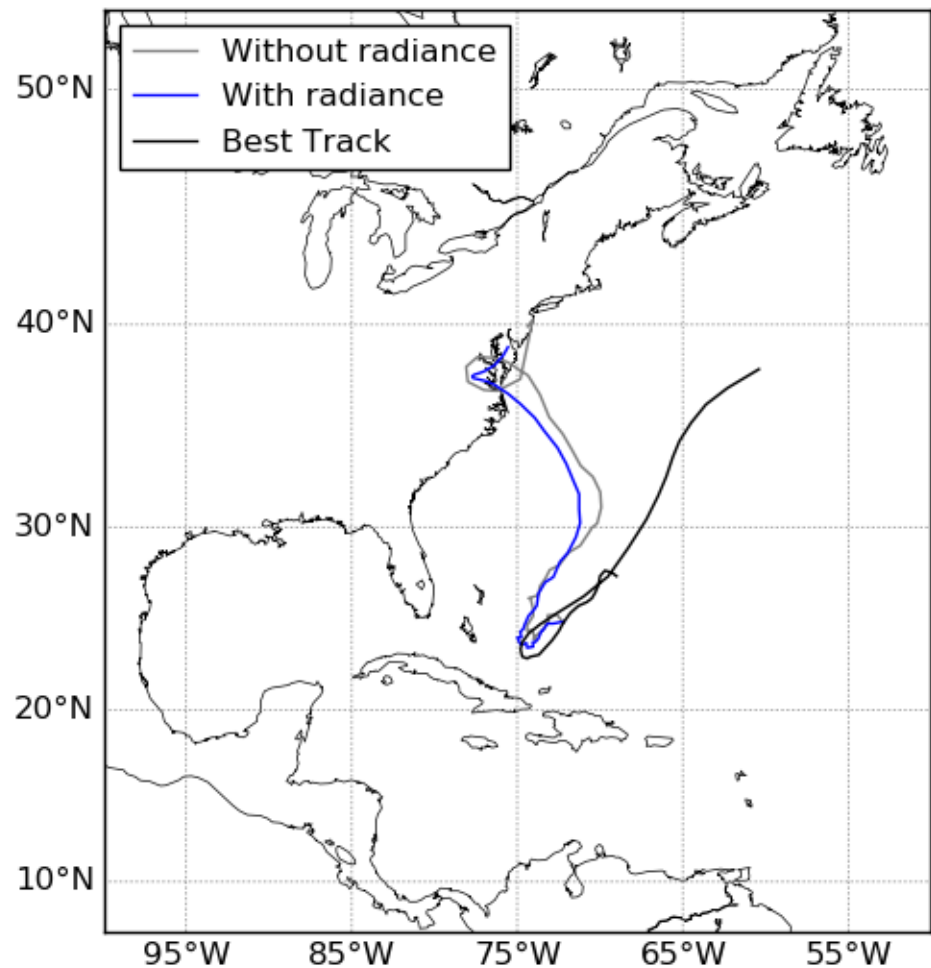

09/29/12

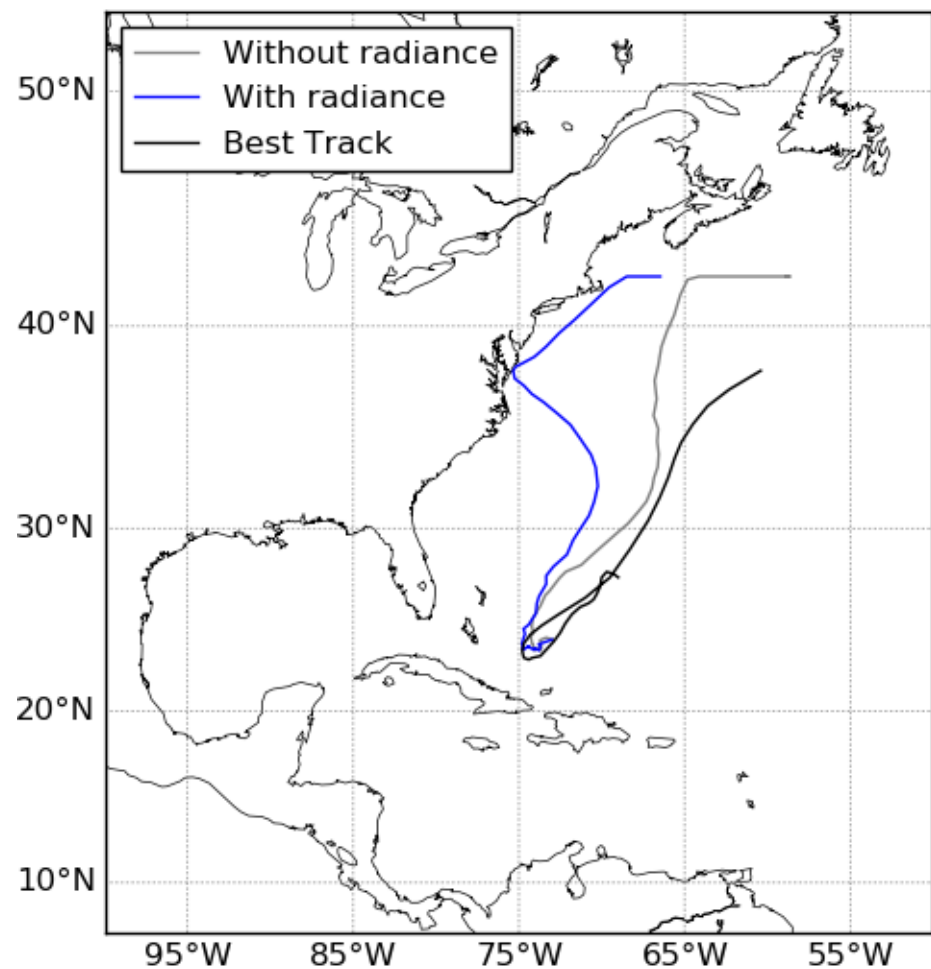

09/30/00

09/30/12

10/01/00

Conclusion

1. After the satellite data (GOES-13 channel 3) been digested into the initial conditions, quite a lot improvement can be obtained on the intensity forecasts while not too distinct on the track forecasts.

Initiated at 09/29/06
